<div>

Introduction

The div name tag derives from hyphenation, this tag defines areas or sections within an HTML page. Anyway, almost all web designers use the word 'layer' to mean 'split'. While this is a big mistake, it's best to continue calling the areas marked with 'categories' to be able to interact with other designers.

Definition

What is div?

The label can be nested, so it is used to structure the content of a web page in blocks. In this example, we have a section that consists of two sections, each of which contains three paragraphs. div "partition". It is used to create sections or group content. Its child tags: <div> and </div> (required).

It is defined as: a block element or create boxes: batch.

May contain: text and/or zero or more blocks or inline elements. The label

It is used to define a content block or a section of a page, to be able to apply different styles, and even perform on that particular block. Its name is due to the way it occupies space in the created document. universal features. Block element means occupancy element If borders are shown around the element, the block element will look like this in the document: the full width of the document is available, creating a line break at the end of the element.

The label also supports generic HTML attributes.

Attribute	Description
