Date: 03-06-2022
NRC: 4628

Problem

Lack of a means of communication that adapts to new technologies that allows us to sell and promote pharmaceutical products and services in an easy and intuitive way.

Solution

Creation of a page that manages to synthesize the ideas that a pharmaceutical company needs to sell or promote, offering different options to the user to satisfy their needs.

Overview

The website will allow the user to browse and access the products of an online pharmacy, so that they can learn more about the products, offers, services, comments and customer service that satisfies the purchase of medicines online from said pharmacy.

Background

Develop a web application for a pharmacy using web programming languages such as html and css for the structuring and design of the application and java script to generate dynamism, this will allow the user to easily and quickly access the information of the pharmaceutical establishment.
